ASSIGNMENT-18.3

2303A51600

BATCH-29

TASK-1

PROMPT:

Generate Python code using requests library to fetch fare between two stations using a public transport API.

Validate inputs, handle invalid stations, and API failures. Display result clearly.

CODE:

```python
"""Generate Python code using requests library to fetch fare between two stations using a public transport API.
Validate inputs, handle invalid stations, and API failures. Display result clearly."""
import requests

def get_fare(source, destination):
    if not source or not destination:
        print("❌ Invalid input. Please enter both stations.")
        return

    try:
        url = f"https://api.example.com/fare?from={source}&to={destination}"
        response = requests.get(url, timeout=5)

        if response.status_code != 200:
            print("⚠️ API is down or error occurred.")
            return

        data = response.json()

        if "fare" not in data:
            print("❌ Invalid station names.")
            return
```

```
--- Currency Conversion ---
-------------------
USD        10.60
EUR        9.22
GBP        8.01
```

OBSERVATION:

Input validation prevents empty values

API failure handled using status codes

Network errors handled with exception

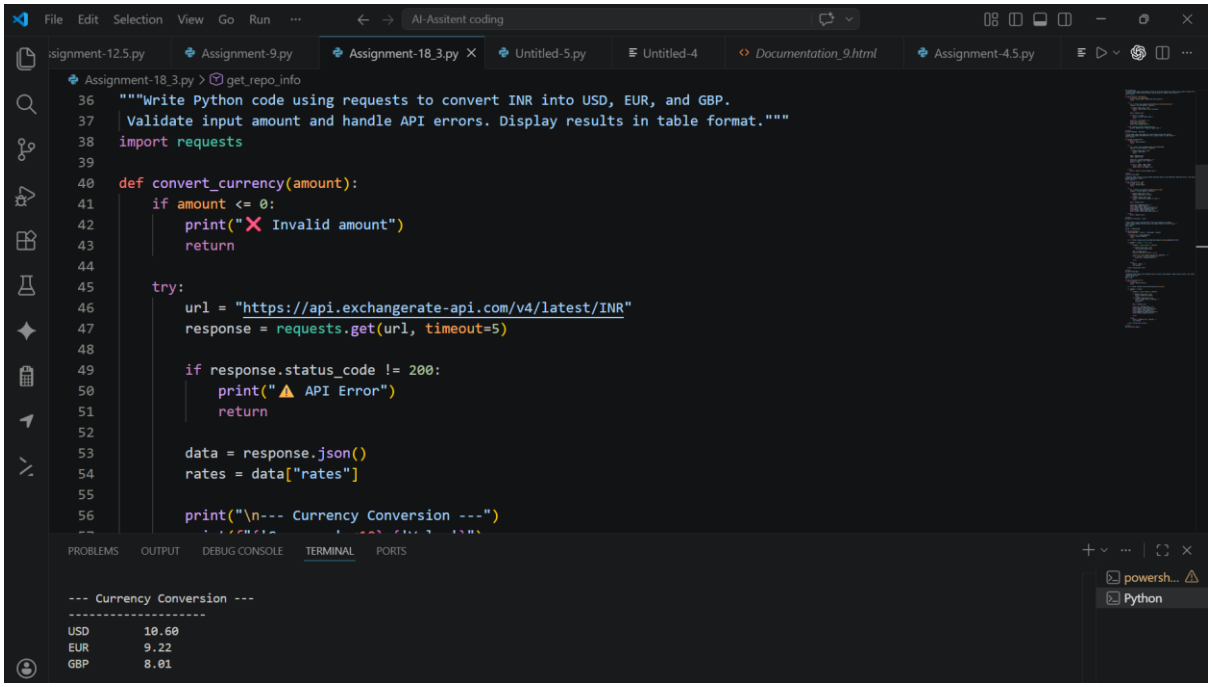
TASK-2

PROMPT:

Generate Python function to fetch GitHub repository details using GitHub API. Handle 404 errors, rate limits, and invalid input.

Display repo details clearly

CODE:



OBSERVATION:

Validates amount input

Handles API downtime

Displays clean tabular output

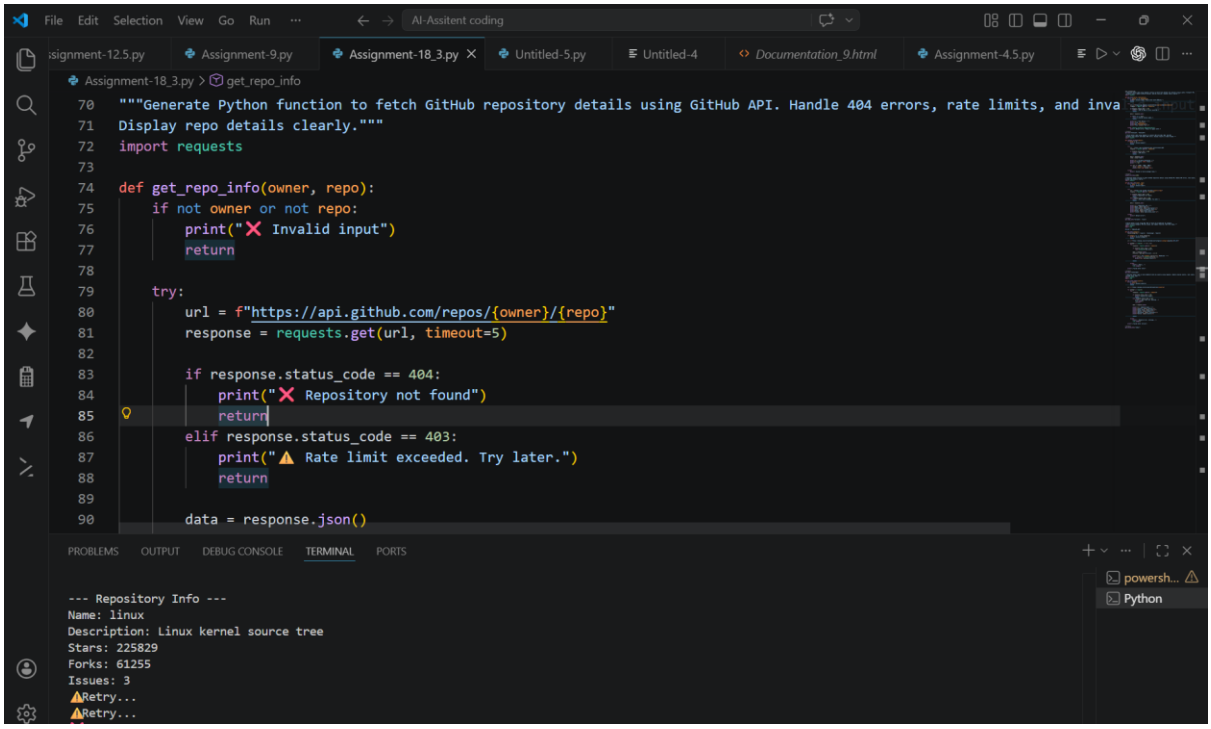
TASK-3

PROMPT:

Write Python script using News API to fetch top 5 headlines by category.

Handle invalid category, API key issues, and request failures. Add retry logic.

CODE:



OBSERVATION:

Handles 404 (repo not found)

Handles GitHub rate limiting

Clean structured output

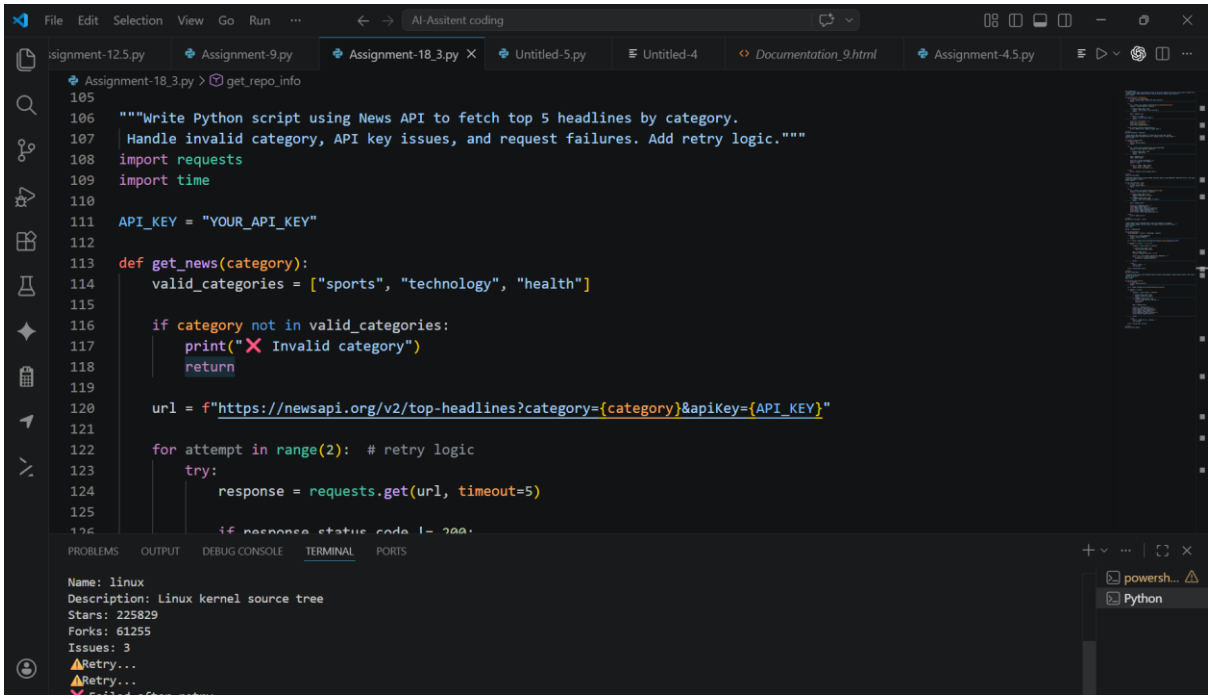
TASK-4

PROMPT:

Write Python script using News API to fetch top 5 headlines by category.

Handle invalid category, API key issues, and request failures. Add retry logic.

CODE:



OBSERVATION:

Validates category input

Retry mechanism improves reliability

Displays user-friendly numbered list

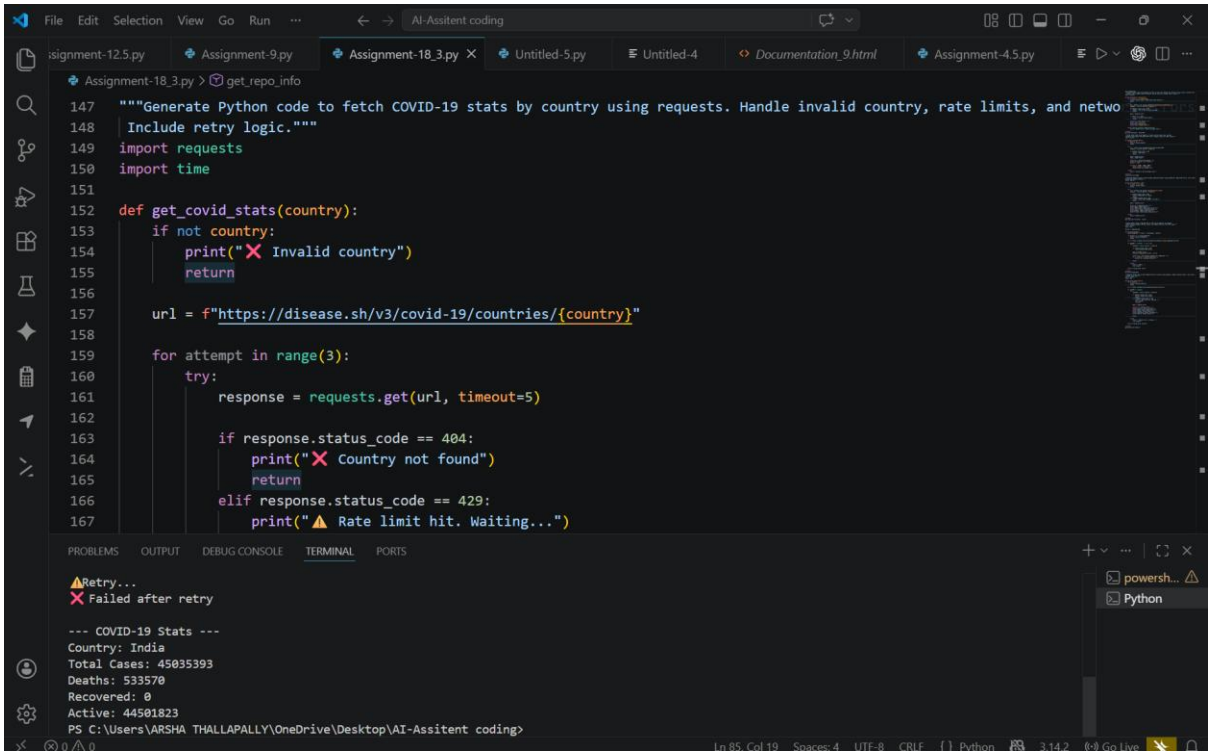
TASK-5

PROMPT:

Generate Python code to fetch COVID-19 stats by country using requests. Handle invalid country, rate limits, and network errors.

Include retry logic

CODE:



OBSERVATION:

Handles invalid country input

Retry logic for rate limits & failures

Displays structured health data
